Mold Assessment

The goal of mold remediation is to remove and or clean mold damaged materials using work practices that protect occupants by controlling the dispersion of mold from the work area and protect remediation workers from exposures to mold. The size of the area impacted by mold growth, as well as practical considerations will define remedial procedures. Our process starts with a Certified Mold Assessor evaluating your individual situation. This is accomplished thru occupant interviews and visual assessment. Building materials affected will be identified and observations of hidden areas where mold may be present, such as, crawl spaces, attics, and behind wallboards will be evaluated using state of the art equipment. Pschrometers, infrared cameras, and borescopes may be utilized in this process. The source of the moisture and repair recommendations will be noted. The findings of the assessment will be reviewed with you and a project cost with completion date will be submitted for your approval. Upon your approval, a site specific mold remediation protocol will be formulated by our certified mold assessor.
